- Nissan LEAF Technologies and Repair Considerations

Nebraska Auto Body Association

ABS is now a Vendor Committee member for the NABA. We want to provide additional training and educational opportunities, encourage and educate youth about our trade and work towards making changes to improve the auto body industry.

The NABA is working to reorganize and bring new goals, ideas and opportunities to the table.

We need everyone's support to make changes and improvements in our industry possible. Please help us by joining the NABA today!

PRE-CLEANER BEST PRACTICES

Pre-Cleaners are a critical component to the painting process. Both a waterborne and solventborne cleaner should be used to remove all contaminants from a surface. When using a pre-cleaner such as OneChoice® SX330 Wax and Grease Remover or SWX350 H2O-So-Clean® Waterborne Pre-cleaner, **DO NOT** allow the cleaner to dry on the panel. Cleaners are designed to float contaminants to the surface and then be wiped with a clean, dry cloth. If it is not completely wiped dry before painting, wipe marks may be evident in the finished film. This may lead to paint failures such as blistering and adhesion loss.

Whether you use cleaner from an aerosol can or a pump applicator, always apply utilizing this "Spray on/Wipe off" procedure.
